Progressive Web App

These checks evaluate the success of a Progressive Web App. [Lighthouse](#)

- Fast and reliable**
 - 1 Page load is not too long on mobile networks
 - 2 Your page loads the same way in all supported mobile environments. List of all configurations and compatibility in the "Troubleshooting" section in the report below
 - 3 Content jumps around not triggered with a 3G or slower offline
 - 4 PWA will show not respond with a 200 status offline
 - 5 Unable to load a user ID, no service worker
- Installable**
 - 6 User is PWA
 - 7 Does not require a service worker that controls pages and assets only
 - 8 Your app manifest does not meet the installability requirements
 - 9 App name, short name, display, icons, maskable, verified does not have valid values
- Peak Optimized**
 - 10 Features to HTTP 2.0 ready, to HTTP2
 - 11 Is not configured to do content-based routing
 - 12 Resource Size: Images not using a PWA can't do as good as usual. Manifest does not have background color
 - 13 Does not use an address bar Theme color
 - 14 Manifest does not have Theme color
 - 15 Manifest does not have Theme color
 - 16 Manifest does not have Theme color
 - 17 Manifest does not have Theme color
 - 18 Manifest does not have Theme color
 - 19 Manifest does not have Theme color
 - 20 Manifest does not have Theme color

Improvement tips for 2023

- Largest real-world impact
- Relevant and applicable to most sites
- Realistic to implement

Google Core Web Vitals

Loading

Largest Contentful Paint (LCP)

Interattività

First Input Delay (FID)

Stabilità visiva

Cumulative Layout Shift (CLS)

Ensure the LCP resource
is discoverable 
from the HTML source

72% of mobile pages
LCP element = an image

39% of those images
not discoverable from HTML source

- Load the image using an `` element with the `src` or `srcset` attribute
- Prefer server-side rendering (SSR) over client-side rendering (CSR)
- If your image needs to be referenced from an external CSS or JS file, include it in the HTML source via a `<link rel="preload">` tag.

Ensure the LCP resource
is prioritized ▲

- Add `fetchpriority="high"` to the `` tag of your LCP image
- Never set `loading="lazy"` on the `` tag of your LCP image
- Defer non-critical resources when possible

Use a CDN  to optimize
document and resource
server-time (TTFB)

Serve your content as geographically close to your users as possible.

Cache that content so recently-requested content can be served again quickly.

- Increase how long content is cached for.
- Cache content indefinitely, and purge the cache on updates.
- Move dynamic logic from your origin server to the edge

Avoid or break up 
long tasks

Tasks include rendering, layout, parsing and compiling and executing scripts.

50ms of main-thread blocking threshold for a task to be considered “long”.

19 is the median number of long tasks on mobile

- Break up long tasks into smaller ones, yielding often to the main thread
- Consider using APIs such as isInputPending and the Scheduler API.

Avoid unnecessary

JavaScript

460 kb / page

median of JS code served to each page

Too much Javascript

create an environment where tasks are competing for the main thread's attention

- Use the coverage tool in Chrome DevTools to find unused code
- If unused because it will be used later, move to separate bundle - code splitting
- Using a tag manager?
Periodically check your tags.

Avoid large 
rendering updates

Javascript is not the only thing that can affect your website's responsiveness.

Rendering can be expensive and can interfere with your website's ability to respond to user inputs.

- Avoid using `requestAnimationFrame()` for doing any non-visual work.
- Keep your DOM size small.
- Use CSS containment (`contain` property)

Largest Contentful Paint (LCP)

Interattività

First Input Delay (FID)

Visual stability

Cumulative Layout Shift (CLS)

Set explicit sizes 
on any content loaded
from the page

0px initial default height
for unsized images

72% of pages
have at least one unsized image

- Explicitly set `width` and `height` attributes (or equivalent CSS properties) on images
- Use the `aspect-ratio` CSS property to reserve space for other lazy loaded content (ads, embedded videos, etc.)
- If aspect is unknown, use `min-height`

Ensure pages are eligible
for back/forward cache
(bfcache) 🤔

35% of pages are
ineligible for the bfcache

- Check if your pages are eligible for the bfcache using [bfcache tester](#) in DevTools
- Work on the reasons why they are not

Avoid animations and transitions  that use layout-inducing CSS properties

15% less likely to have "good" CLS
if you animate any CSS property that
could affect layout

Absolutely positioned elements that
animate top or left will cause layout shifts

- Never animate or transition CSS properties that require browsers to update page layout
- Instead of animating `top` or `left`, animate `transform:translateX()` or `transform:translateY()`

Let's wrap up

- + organic traffic
- + brand perception
- + conversion rate
- – carbon footprint
